WO 02/082808 A1

(57) Abstract: A system and method for providing an electronic program guide for television or radio programs includes presenting listings of present or future programs on-screen, presenting listings of past programs on-screen and indicating whether the past program is available again at a future time. Also, a system and method for handling information controllable from an electronic program guide for television or radio programs comprises receiving information in a user's system, storing the received information in the user's system, displaying access to the stored information by means of a user interface and enabling the user to select one of a plurality of management options for controlling the operation of the stored information through the user interface.

WO 02/082808 A1

For two-letter codes and other abbreviations, refer to the "Guidance Notes on Codes and Abbreviations" appearing at the beginning of each regular issue of the PCT Gazette.

GEMSTAR DEVELOPMENT LIMITED

The present invention relates to an improved electronic program guide (EPG) for a television or radio system. The present invention, in further 5 embodiments, also relates to a system for handling information controllable from an EPG, particularly but not exclusively for a set-top-box (STB) connected within a television or radio system.

Many electronic program guide (EPG) systems have emerged over the past 10 few years. These display listings information for television or radio programs to assist users to plan their television viewing or radio listening for the coming few days. Such systems may provide a record function whereby a user highlights and selects on-screen a portion of listing information, thereby to activate a record or watch or listen (for radio) function for the program 15 selected by the user. Such systems may also provide a means for receiving targeted advertising provided by the service provider in the form of advertisements being sent to the user's system and displayed in the EPG.

In the case of a user selecting a record function, the system may control a 20 recording device (e.g. VCR, PVR, DVD, audio-cassette, MiniDisc or DAT recorder) to record the desired program on the right channel and at the right time. In the case of a user selecting a watch function, the system may cause an icon or reminder message to be displayed on the television screen a short while before the desired program is to be broadcast. Alternatively the system 25 may cause an audible alarm to be sounded.

The effectiveness of finding and recording or watching a desired program in this way depends upon on the ease of use of the particular EPG and upon a

user's inclination to consult it properly. With even the most user friendly EPG, users often forget or cannot spare time to browse desired programs. In order to solve this problem and provide more sophisticated functionality, some EPGs infer programs of interest to users and record them without any user 5 intervention. Inferences are made by inviting users to rate program titles displayed within the EPG according to whether they are explicitly of interest. An alternative, implicit approach infers programs of interest by monitoring whether programs possessing similar characteristics were viewed in the past. In either case, a rating algorithm is employed by the EPG system to decide 10 whether each program carried within the EPG listings data is of sufficient interest to warrant recording. Such methods increase the likelihood that a desired program will be recorded. However, these systems are not infallible and often fail to record programs reliably and may either be too indiscriminate or miss specific programs of interest.

15

An object of the invention is to provide an electronic program guide with improved functionality.

20

A further preferred embodiment of the present invention is directed to providing an improved EPG for a television or radio system in which non-volatile means is provided to record programs or data, such as advertising data or general information, for subsequent viewing.

25

According to a first aspect of the present invention, there is provided a system for providing an electronic program guide for television or radio programs that includes:

means for presenting listings of present or future programs on-screen;
means for presenting listings of past programs on-screen and

means, associated with the on-screen listings of past programs, for indicating whether the past program is available again at a future time.

In this way, users can identify programs desired for watching or recording
5 based upon those they have missed in the recent past. This is advantageous, because with the continuing trend towards increasing numbers of channels, there are growing probabilities that a missed program will be repeated in the not too distant future, either on the same channel or on a different one. Hence, by linking a past program within the EPG to future repeats of that program,
10 viewers can readily identify and select a future program based on a missed past program.

The means indicative of the availability of the past program at a later date, may be operable to highlight within the on-screen listings of past programs,
15 programs that are to be repeated.

Preferably, means are provided for receiving a user selection of a past program. Means responsive to the user selection may be provided for generating options for the user to select. The options may include record or
20 watch functions. Means may be provided so that on selection of the record function, the system is automatically set to cause a repeat of the selected past program to be recorded. Means may be provided so that on selection of the watch function, the system is automatically set to notify the viewer when a repeat of the selected past program is about to be broadcast.

25

The guide may be presented in a grid format, with time along one axis of the grid and channel along another axis of the grid. Time is preferably along a

horizontal axis of the grid and channel is preferably along a vertical axis of the grid.

According to a second aspect of the present invention, there is provided a
5 computer program, preferably on a data carrier, for providing an electronic
program guide for television or radio programs, the computer program
including instructions for:

presenting listings of present or future programs on-screen;
presenting listings of past programs on-screen and
10 indicating in association with the on-screen listings of past programs
whether the past program is available again at a future time.

According to a third aspect of the present invention, there is provided a
method for providing an electronic program guide for television or radio
15 programs that includes:

receiving program listings information;
presenting listings of present or future programs;
presenting listings of past programs and
indicating whether the past program is available again at a future time.
20

The step of indicating may involve highlighting in the guide programs that are
to be repeated.

The method also may involve receiving a user selection of a past program and
25 generating options for the user to select. The options may include record or
watch functions. Preferably on selection of the record function, recording of a
repeat of the selected program is set automatically. On selection of the watch
function, the method may further involve automatically notifying the viewer

when a repeat of the selected program is about to be broadcast. This may be done by generating and presenting an icon a pre-determined time prior to the start of the program.

- 5 According to a fourth aspect of the present invention, there is provided a system for providing an electronic program guide for television or radio programs that includes:
- means for presenting listings of present or future programs on-screen;
- means for presenting listings of past programs on-screen;
- 10 means for receiving user selections of functions associated with past programs, for example recording or watching or listening;
- means for identifying whether the past program is to be repeated and
- means for activating the selected function associated with the past program in the event that the past program is repeated.
- 15 The means for identifying whether the past program is to be repeated may comprises means for searching the past and future listings to determine a match between the listings information.
- 20 Means may be provided, associated with the on-screen listings of past programs, for indicating whether the past program is available again at a future time.
- 25 According to a fifth aspect of the present invention, there is provided a method for providing an electronic program guide for television or radio programs, the method involving:
- presenting listings of past programs on-screen;

receiving user selections of functions associated with past programs, for example recording or watching or listening;

identifying whether the past program is to be repeated; and

activating the selected function associated with the past program in the event that the past program is repeated.

The step of identifying whether the past program is to be repeated may comprise searching past and future program listings to determine a match between at least part of the listings information. The part of the listings information compared may be a program and/or episode identifier.

According to a sixth aspect of the present invention, there is provided a computer program, preferably on a data carrier, for providing an electronic program guide for television or radio programs, the computer program comprising instructions for:

presenting listings of past programs on-screen;

receiving user selections of past programs for recording or watching or listening;

identifying whether the past program is to be repeated; and

causing the repeat of the past program to be recorded or notifying the user of the repeat of the past program, in the event that the past program is repeated.

The instructions for identifying whether the past program is to be repeated may comprise instructions for searching past and future program listings to determine a match between at least part of the listings information. The part of the listings information compared may be a program and/or episode identifier.

According to a seventh aspect of the present invention, there is provided a system for providing an electronic program guide for television or radio programs that includes:

- 5 means for presenting listings of present or future programs on-screen;
and
means for presenting listings of past programs on-screen.

10 Preferably, means are provided for identifying past programs, these means preferably comprising means for comparing the stop time of programs with real time derived from either a real time clock or a downloaded real time signal, thereby to identify programs that have finished. Preferably, this is done each time the electronic program guide is accessed by the viewer.

15 According to an eighth aspect of the present invention there is provided a system for handling information controllable from an EPG for television or radio programs, the system comprising:

- means for receiving information in a user's system;
means for storing the received information in the user's system;
20 means for displaying access to the stored information by means of a user interface; and
control means for enabling the user to select one of a plurality of management options for controlling the operation of the stored information through the user interface.

25 Preferably, the means for storing the received information is Flash memory, DRAM, a non-volatile storage such as a hard disk or an optical storage device.

Preferably, the means for receiving the information is an aerial, satellite, cable or ADSL receiver.

5 Preferably, the system further comprises means for erasing stored information from the means for storing the information.

In a preferred embodiment, the system further comprises means for automatically deleting stored information from the means for storing the information, preferably in response to detection of insufficient storage space
10 for recordal of desired information.

Preferably, the system further comprises means for categorising received information, for example according to subject matter, date of receipt or storage of the information by the system, or channel on which the information was
15 transmitted. In the preferred embodiment, the means for categorising further comprises allocating a colour identifier to different categories of stored information.

20 Preferably, the system further comprises means for searching the stored information, for example, according to date of receipt or storage of the information by the system, subject matter, or channel on which the information was transmitted.

25 Preferably, the system further comprises means for displaying a portion of the stored information in the user interface on selection of associated stored information by the user.

In a preferred embodiment, the means for receiving information is adapted to receive information provided by a service provider, or the user.

Preferably, the system further comprises means for presenting listings of 5 present or future programs on-screen, means for presenting listings of past programs on-screen and means associated with the on-screen listings of past programs for indicating whether or not the past program is available again at a future time.

10 In this way, users can identify programs desired for watching or recording based upon those they have missed in the recent past. This is advantageous, because with the continuing trend towards increasing numbers of channels, there are growing probabilities that a missed program will be repeated in the not too distant future, either on the same channel or on a different one. Hence, 15 by linking a past program within the EPG to future repeats of that program, viewers can readily identify and select a future program based on a missed past program.

20 The means indicative of the availability of the past program at a later date, may be operable to highlight within the on-screen listings of past programs, programs that are to be repeated.

25 Preferably, means are provided for receiving a user selection of a past program. Means responsive to the user selection may be provided for generating options for the user to select. The options may include record or watch functions. Means may be provided so that on selection of the record function, the system is automatically set to cause a repeat of the selected past program to be recorded. Means may be provided so that on selection of the

watch function, the system is automatically set to notify the viewer when a repeat of the selected past program is about to be broadcast.

5 The guide may be presented in a grid format, with time along one axis of the grid and channel along another axis of the grid. Time is preferably along a horizontal axis of the grid and channel is preferably along a vertical axis of the grid.

10 Preferably, the system further comprises means for identifying whether the past program is to be repeated and means for activating the selected function associated with the past program in the event that the past program is repeated.

15 The means for identifying whether the past program is to be repeated may comprise means for searching the past and future listings to determine a match between the listings information.

20 Means may be provided, associated with the on-screen listings of past programs, for indicating whether the past program is available again at a future time.

25 According to a ninth aspect of the invention there is provided a method for handling information controllable from an EPG for television or radio programs, the method comprising:

 receiving information in a user's system;
 storing the received information in the user's system;
 displaying access to the stored information by means of a user interface; and

controlling the selection of one of a plurality of management options for controlling the operation of the stored information through the user interface.

- 5 Preferably, system further comprises means for displaying information, preferably visual, relevant to the status of the stored information, such as whether or not the information has been viewed by the user, and/or whether or not the user has elected to keep or delete stored information, and/or viewing duration of stored information, and/or the progress of viewed information.

10

Various systems and methods in which the invention is embodied will now be described by way of example only and with reference to the accompanying drawings, in which:

15

Figure 1 is a block diagram of a television system;

Figure 2 is a block diagram of a television that is adapted to provide a retrospective EPG;

Figure 3 is a block diagram of a set top box that is adapted to provide a retrospective EPG;

20

Figure 4 is an example of a program listing datum;

Figure 5 shows the program listing datum of Figure 4, including a pointer to a future television program;

Figure 6 is an example of a retrospective EPG that is in a grid format;

25

Figure 7 shows an example of an on-screen display that is presented when a viewer selects the search option in the EPG of Figure 6;

Figure 8 shows an example of an on-screen display that is presented when a viewer selects the “all” option in the on-screen display of Figure 7;

12

Figure 9 shows an example of an on-screen display that is presented when a viewer selects the “football” option in the on-screen display of Figure 7;

5 Figure 10 shows an example of an on-screen display that is presented when a viewer selects the “missed” option in the EPG of Figure 9;

Figure 11 shows an on-screen display that is presented when a viewer selects the “schedule” option in the EPG of Figure 10;

10 Figure 12 is an example of an on-screen display presented when viewing the home page of an EPG embodying a further aspect of the invention where the “Telecast” mode is selected;

Figures 13 and 13a are examples of an on-screen display of the EPG in Figure 12 in “Telecast” mode with the “Past” sub-mode selected with one of a list of program titles in focus;

15 Figure 13b is an example of an on-screen display of the EPG in Figure 12 in “Telecast” mode with the “Past” sub-mode with one of a list of program titles in focus that changed the colour due to a scheduled recording;

Figure 14 is an example of an on-screen display of the EPG of Figure 12 in ”My TV” mode with the “Catalogue” sub-mode selected;

20 Figure 14a is an example of an on-screen display of the EPG of Figure 12 in ”My TV” mode and “Catalogue” sub-mode with one of a list of program titles in focus;

Figure 14b is an example of an on-screen display of the EPG of Figure 12 in ”My TV” mode and “Catalogue” sub-mode with one of a list of series titles in focus;

25 Figure 14c is an example of an on-screen display of the EPG of Figure 12 in ”My TV” mode and “Catalogue” sub-mode with one of a list of episodes titles in focus;

Figure 14d is an example of an on-screen display of the EPG of Figure

12 in "My TV" mode and "Catalogue" sub-mode with one of a list of episodes titles in focus after the "keep" action has been activated;

Figure 14e is a further example of an on-screen display of the EPG of Figure 12 in "My TV" mode and "Catalogue" sub-mode with one of a list of episodes titles in focus;

Figure 14f is an example of an on-screen display of the EPG of Figure 12 in "My TV" mode and "Catalogue" sub-mode with one of a list of episodes titles in focus after the "up" action has been activated;

Figure 15 is an example of an on-screen display of the EPG of Figure 10 12 in "My TV" mode and "Catalogue" sub-mode with one of a list of program titles in focus after the "Erase" action has been activated;

Figure 16 is an example of an on-screen display of the EPG of Figure 12 in "My TV" mode and "Catalogue" sub-mode with one of the status icons in focus;

15 Figure 16a is an example of an on-screen display of the EPG of Figure 14b in "My TV" mode and "Catalogue" sub-mode with one of a list of episodes titles in focus after the OK button was pressed on a series title (shown in Figure 14b);

Figure 17 is an example of an on-screen display of the EPG of Figure 20 14 in "My TV" mode and "Catalogue" sub-mode with the "Unused" cell in focus;

Figures 18 and 18a are examples of an on-screen display of the EPG of Figure 14 with the "Theme" action selected with a theme sub-category cell in focus;

25 Figure 18b is an example of an on-screen display of the EPG of Figure 18a with the "Theme" action selected and after a theme sub-category has been selected;

Figure 19 is an example of an on-screen display of the EPG of Figure

14 with the “Date” action selected with the option “All” being in focus;

Figures 19a, 19b and 19c are examples of an on-screen display of the EPG of Figure 19 with further “Date” options selected;

- 5 Figures 20 and 21a are examples of an on-screen display of the EPG of Figure 14 with the “Channel” action selected with a particular channel cell in focus;

Figure 21b is an example of an on-screen display of the EPG of Figure 21a with a specific channel having been selected and with a program title cell in focus;

- 10 Figure 22 is an example of an on-screen display of the EPG of Figure 14 with the “Box Office” sub-mode selected;

Figure 22a is an example of an on-screen display of the EPG of Figure 14 with the “Box Office” sub-mode selected and a particular program title cell in focus;

- 15 Figure 23 is an example of an on-screen display of the EPG of Figure 14 with the “Info” sub-mode selected;

Figures 23a, 23b, 23c and 23i are examples of on-screen displays of the EPG of Figure 23 as a result of the selection of various articles;

- 20 Figure 23d is an example of an on-screen display of the EPG of Figure 12 with the link in Figure 23c selected and with the focus on the programme title cell of the selected link;

Figure 23e is an example of an on-screen display of the EPG of Figure 12 where the link in Figure 23c was selected resulting in the information panel being expanded for the description of the selected program title cell;

- 25 Figure 23f is an example of an on-screen display of the EPG of Figure 12 with the link in Figure 23i selected and with the focus on the linked advertisement panel;

Figure 23g is an example of an on-screen display of the EPG of Figure

23 with the “Info” sub-mode selected and with the focus on a sub-category;

Figure 23h is an example of an on-screen display of the EPG of Figure 23g with the “Info” sub-mode selected displaying articles of a chosen sub-category with the focus on the top article;

5 Figure 23j is an example of an on-screen display of the EPG of Figure 23 with the “Info” sub-mode selected displaying articles of a chosen sub-category with the focus on the top article;

Figures 24 and 25 are examples of an on-screen display of the EPG of Figure 23 with the “Info” sub-mode selected and with the focus on a sub-
10 category;

Figure 26 is an example of an on-screen display of the EPG of Figure 23 with the “Info” sub-mode selected displaying articles and sub-categories of a chosen sub-category;

15 Figure 27 is a block schematic of a personal video recorder (PVR) system for use with the EPG system embodying the invention;

Figure 28 is a block schematic of the individual function elements of the PVR of Figure 27.

The retrospective electronic program guide in which the invention in a first
20 aspect is embodied allows a viewer to see listings for programs that were broadcast in the past. It additionally links past broadcasts to future repeats of the past broadcast, thereby enabling viewers to easily identify when a repeat of a missed program is to be broadcast. It will be appreciated that the invention could be applied to television or radio systems. For the sake of clarity,
25 however, the specific embodiment is described with reference to a television system.

Figure 1 shows a television 1 that is operable to communicate with a set top box 2 via a RF link and a SCART cable. Each of the television 1 and the set top box 2 is controllable by its own dedicated remote control. The television 1 may also, optionally, be connected to a video recorder. In order to provide an 5 EPG, a processor is provided. This can be located in either of the set top box 2 or in the television 1 itself.

Figure 2 shows an example of a television that is adapted to implement a retrospective EPG. This includes a CPU 3 that is connected to a data bus 4 10 and able to communicate with a flash RAM 5, a DRAM 6, an IR receiver 7 for receiving user selections from the television remote control, a real time clock 8 (RTC), an on-screen display generator 9 for generating the EPG, a teletext or P3.1 decoder 10, a PDC/VPS decoder 11 and a programmable tuner 12. Software for generating the electronic program guide is stored in the DRAM 6 15 and television listings data is stored in either of the flash RAM 5 or the DRAM 6. The CPU 3 uses the EPG software and the listings data to generate and send signals to the on-screen display generator 9, thereby to cause the EPG to be displayed on screen. Typically, this is done in response to a user command which is received at the IR receiver 7.

Connected to the programmable tuner 12 is a PAL/SECAM video decoder 13, 20 which is in turn connected to a video scaler 14 that feeds signals to a video mixer 15. Also connected to the video mixer 15 is the on-screen generator 9, so that EPG and other such data can be mixed with the video signal for display 25 on the television screen.

Figure 3 shows an example of a set top box that is adapted to implement a retrospective EPG. As described above for the television of Figure 2, the set

top box of Figure 3 includes a CPU 17 that is connected to a data bus 18 and able to communicate with a flash RAM 19, a DRAM 20, an IR receiver 21 for receiving user selections from the set top box remote, a real time clock (RTC) 22, an on-screen display generator 23 for generating the EPG, a teletext or
5 P3.1 decoder 24 and a programmable tuner 25. As before, software for generating the electronic program guide is typically stored in the DRAM 20 and television listings data is stored in either the flash RAM 19 or DRAM 20. The CPU 17 uses the software and the listings data to generate and send signal to the on-screen display generator 23, thereby to cause the EPG to be
10 displayed on screen. Typically, this is done in response to a user command which is received at the IR receiver 21.

Connected to the programmable tuner 25 is a PAL/SECAM video decoder 26, which is in turn connected to a video scaler 27 that feeds signals to a video
15 mixer 28. Also connected to the mixer 28 is the on-screen display generator 23. The EPG is displayed by generating a video signal using the OSD 23 and combining it with the TV video signal before re-encoding and modulating to give an RF output or, alternatively/additionally, outputting directly in RGB or CVBS form to the TV via a SCART connector.
20

Television listings data for the EPG is typically downloaded in the vertical blanking interval (VBI) of a pre-determined channel and stored within the EPG system in the Flash RAM 5, 19 in advance of a user's interaction within the EPG System. This is the so called "cache" method. Alternatively, listings
25 data may be broadcast repetitively, again typically in the VBI of a pre-determined channel, and downloaded to the EPG system during interaction with the user. This is the so called "carousel" method. In either case, the CPU 3, 18 of Figures 2 and 3 is operable to execute a firmware program within

memory that causes it to power up from standby when triggered by the real time clock 8, 22 or by a user selection.

After power up, the CPU 3, 18 causes the programmable television tuner to 5 tune the television channel carrying the EPG listings data and receive the downloaded television listings. During the download period, the VBI portion of the video signal for each line in each video raster is converted to a bit stream by the VBI data slicer and further decoded to extract the service data. In the embodiment described this is performed by decoding according to the 10 WST Packet 31 IDL-A and IDL-B data formats. After decoding, this data is stored in DRAM and/or Flash memory and selectively processed as described earlier.

Each program listing datum that is downloaded typically includes the 15 following:

- an event ID, which is indicative of a unique broadcast event (e.g. live coverage of a sports event);
- a title ID, which is indicative of the show title;
- flags that are indicative of the broadcast format, e.g. PAL/stereo etc;
- a descriptive/narrative text that describes the program;
- a theme ID, which identifies the theme of the program, e.g. sports or film or soap opera etc;
- a show ID which includes a series ID and, where appropriate, an episode ID;
- a time ID, which includes start and stop times for the program;
- a channel ID that is indicative of the channel of the program;

An example of a listing datum is shown in Figure 4.

In prior art systems, television listings associated with past broadcasts are not downloaded or are deleted from memory as soon as the television broadcast is finished. In order to implement a retrospective guide, however, it is important
5 that the EPG has access to data on past broadcasts. In order to ensure this, in the case of the cache method, each listing datum is retrospective for a pre-determined retention period after the program is broadcast, before it is erased. In this case, retrospective data is identified by comparing the start and stop times in the listing datum with the time indicated by the real time clock or by
10 receiving a real time signal. For the carousel method, broadcast of each program's listing continues for the retention period after the program itself has been broadcast. Listings that refer to such previously broadcast programs are referred to hereafter as "retrospective" listings. Listings that relate to programs to be broadcast in the future are referred to as "future" listings. In this way,
15 television listing information for past programs is made available to the user for a pre-determined time after the programs are finished.

Upon completion of a cache download of the listings data, the CPU 3, 18 scans through each program identifier belonging to the retrospective listing
20 data to determine whether a match exists with the identifiers belonging to the future listings data. Each retrospective listing datum where a match is found is tagged with a non-null numerical data pointer to the future listing, for example the program identifier shown in Figure 5, which uniquely points to a single item of program content (e.g. "Citizen Kane") or series/episode combination
25 ("New Avengers", episode 6). Otherwise, if a match is not found, the pointer is tagged with a null value. When the matching process is complete, unmatched retrospective listings data may optionally be erased to conserve memory.

A similar process occurs for the case of carousel downloading. In this case, some or all of the broadcast retrospective listings data are downloaded. The CPU 3, 18 then scans through each program identifier belonging to the retrospective listing data to determine whether a match exists with the identifiers belonging to the future listings data. This occurs in real time as the future listings data is being received. Again, each matched retrospective listing datum is tagged with a non-null numerical data pointer to a future listing.

10

Once the appropriate retrospective and future listings data is received, the CPU 3, 18 can construct the retrospective EPG in response to a user selection of the guide. The preferred method of display is as an array or grid of irregular cells 30, where each cell denotes a retrospective or a future listing whose length along one dimension represents a program's duration. This is shown in Figure 6.

20

Each cell 30 of the EPG of Figure 6 is marked with the program's title. The EPG is responsive to commands which are typically received from a remote control, associated with either of the set top box or the television. A user presses up, down, left or right cursor keys on a remote control unit to switch focus backwards or forwards between cells in time in one dimension (vertical columns or horizontal rows of cells) and, optionally, through channels in another dimension (horizontal rows of cells or vertical columns respectively).

25

The cell under focus is differentiated in colour, shading or style from unfocussed cells. A portion of the descriptive and/or narrative information of the listings information, that corresponds to the program denoted by the cell

under focus, is displayed in a second area that does not overlap the grid of cells, for example at the top of the guide as shown in Figure 6.

- The user may activate either a watch or record process for the program cell of focus. Systems for doing this are known and so will not be described herein in detail. In the present invention, however, watch or record functions can be activated for a past or a future program, by pressing a key on the remote control unit that corresponds to the respective function. In the case of past programs, the CPU identifies the datum listing for the selected past program and looks for the future listings data pointer, which points to the listing for the future program that corresponds to the selected retrospective listing. Once this future listing is identified, it is used to set up the function selected by the viewer. When a future program is selected, the listing associated with that program is itself used to set up the function selected by the user. In this way, on receipt of a user selection the CPU is operable to control the system to automatically set up the necessary hardware to carry out the requested function, regardless of whether the program selected is a past or future broadcast.
- The EPG can be generated in such a manner as to allow users to scroll seemlessly between past and future programs, as shown in Figure 6. Alternatively, the EPG may be adapted to present and future listings as a default setting and include an interactive “history” or “missed” button, which when selected causes the CPU to generate and cause the display of a dedicated past programs EPG. In either case, prior to presenting a program listing datum on screen, the EPG system determines whether its pointer to a future listing datum is non-null. If so, the cell is differentiated in appearance from cells which represent programs that are not definitely to be repeated (e.g. by

displaying it in a different shade, colour, border etc.), thereby making past programs that are to be repeated, readily identifiable by viewers. The CPU causes a user selectable interactive hot-key button to be displayed that represents a watch and/or record function that is activated by the user pressing 5 a corresponding key on a remote control unit.

When a user selects a watch or record function, the EPG system looks up the future listing datum that is pointed to by the retrospective listing pointer and marks it for recording by setting a logical data flag associated with it in non-volatile memory for later access by the watch and/or record functions. 10 Alternatively, the time and channel of the future program is committed to non-volatile memory. Optionally, cells may change appearance in order to signify that a watch/record function has been selected.

15 The system is additionally adapted to allow a user to select the watch and/or record function for retrospective listing cells whose programs are not definitely to be repeated. In this case, user selectable hot-key buttons representing watch and/or record functions are displayed to the screen also for these cells. Where the cell under focus is not definitely to be repeated, the 20 CPU causes the retrospective listing's program identifier to be stored to non-volatile memory together with an identifier for the type of operation to be performed (e.g. record, watch). Additionally, descriptive listings information (such as title, text description) may be stored alongside the identifier in order to enable a facility for users to review and cancel programs that they have set 25 to record and/or watch. During each successive download of future listings data, the EPG system compares the stored retrospective listing's program identifier with the downloaded information and attempts to find a match between that stored retrospective listing identifier and those of the future

listings. If in time a suitable match is found, the function selected by the user is activated.

- In addition to accessing schedule information using the EPG of Figure 6, the
5 system is operable to allow a user to search for a program according to its theme (e.g. sports, movies). This is typically done by pressing keys on a remote control unit to focus on a cell that denotes a theme of interest. To enable this, the EPG of Figure 6 includes an interactive “search” button, which when selected presents the user with various theme options that are available.
10 As shown in Figure 7, these may include movies, sport and children and additionally news, gardening cooking etc. When a user selection of one of the theme options is received by the CPU, a list of further more detailed options is presented. Figure 7 shows an example of a list that is presented when the “sports” option is selected. In this case, the further selections that are
15 available include:

all
football
tennis
motorsport
20 boxing
skiing.

Included in the interface of Figure 7 is an interactive “missed” button, which when selected causes the CPU to search for and display programs meeting the selected theme criteria and which were broadcast in the past.

25 Upon selecting a desired cell in the interface of Figure 7, the EPG system displays another interface that has an array of further cells corresponding to programs that belong to the selected theme. For example, if the “all” option of

Figure 7 is selected, the CPU searches all of the retrospective and the future listings and presents a list of the programs identified, as shown in Figure 8. A portion of the descriptive and/or narrative of the listings information, that corresponds to the program denoted by the cell under focus, is displayed in a second area that does not overlap the listings array. As before, to change focus between the cells the system is adapted to recognise commands from the remote control, which commands are generated by pressing the appropriate keys. In particular, the watch or record function for the program in focus can be selected by pressing a key on the remote control unit that corresponds to that function.

As another example, if the “football” option of Figure 7 is selected, the CPU searches all of the retrospective and the future listings and presents a list of the programs identified, as shown in Figure 9. If the “missed” button is then selected, the CPU searches the listings presented to identify and cause the display of those that correspond to retrospective listings information. An example of this is shown in Figure 10. As before, programs that are to be repeated in the future are highlighted, e.g. “Football Italia” in Figure 10, so that if desired, the user can select that future repeat for watching or recording. This is done by moving the cursor onto the desired program and selecting the “schedule” option. It should be noted, however, that the only program that is definitely to be repeated in the EPG of Figure 10 is “Football Italia”.

When the desired program is highlighted and the schedule option selected, the screen shown in Figure 11 is presented to the viewer. The viewer is then given the option of either selecting the program for watching or recording. If the viewer selects “record”, the CPU automatically sets up the system to record the selected program. If the viewer selects “watch”, the CPU

automatically sets up the system to generate an icon for presenting to the viewer prior to broadcast of the selected program, thereby to alert the viewer the imminent broadcast of the program. Alternatively, the system could be adapted to automatically cause the television to tune to the selected program at 5 the time of broadcast.

By providing a retrospective EPG, the user has the option of identifying programs that they missed for possible future viewing or recording on another occasion. This enhances the functionality of the EPG and provides the user 10 with an easy way of selecting and viewing desired programs. This is advantageous.

Embodiments of the electronic program (EPGs) embodying the invention are responsive to commands that may be received from a remote control 15 associated with the television or set-top box (STB). A preferred EPG shows a display comprising a plurality of labelled cells, some of which are “interactive” in the sense that a user may initiate “actions” associated with them. Only one of said cells, the “focussed” cell, is interactive at a given time. The focussed, interactive cell is differentiated from the other interactive cells 20 by means of rendering it differently in some visual way, e.g. by giving it a different colour font or background, or some combination of these and other methods. A user may choose which interactive cell to place in focus by “navigating” to it by pressing up, down, left and right on a remote control unit.

25 Keys may be pressed directly on the remote control to perform actions relevant to the focused cell, and include four “hot” keys coloured red, green, blue and yellow whose action labels are displayed inset within their on-screen graphical key representations on an action menu.

Figure 12 shows an example of an on-screen display that is presented as the first "home" page 100 of an electronic program guide (EPG) embodying a further aspect of the invention when an EPG key on a user's television remote control is pressed. This displays the EPG in "Telecast" mode where telecast television programs are plotted as program title labelled cells against scheduled time and telecast channel.

The home page 100 includes a "picture-in-graphic" box 120, one or more advertisement panels 140, an action menu 160 comprising a plurality of action labels, an information panel 180, a menu bar 200, a channel panel 220 consisting of channel icon cells 230 and a program title grid 240.

The actions available through the action menu 160 on the home page 100 comprise a "watch" option 260, a "record" option 280, a "channels" option 300 and a "My TV" option 320. The action menu 160 may be located at the top of the page spaced horizontally across the display. The information panel 180 may be located below the action menu 160 on the display and may display textual information pertinent to the focused cell. This textual information contains program notes (e.g. synopsis, mono, telecast channel, duration) where the focused cell corresponds to a program. Otherwise it corresponds to descriptive, explanatory text (typically termed "context help") to assist usage of features associated with the focused cell.

The menu bar 200 may be located below the information panel 180 and is coloured blue or otherwise rendered in a distinctive style to denote that it is associated with the EPG "Telecast" operating mode. The menu bar comprises a row of cells denoting sub-operating modes: "Grid" 340, "Search" 360,

“Schedule” 380 and “Info” 400. The “program title” grid 240 comprises an array of cells 420, each cell carrying a different program title. The cells 420 may be of varying horizontal lengths, the length of each cell 420 denoting the duration of the program whose title is displayed in the cell. Each row of cells 5 is allocated to a different channel. Different categories of programs such as sports and movies may be colour coded to assist the user in immediate identification of different program types. Highlighting a particular program title cell 420 results in the information panel 180 displaying program notes concerning the highlighted program and may include a portion of the listings 10 information corresponding to the selected program cell, as shown in Figure 12.

The channel panel 220 comprises a vertical column of single channel cells 230, each cell 230 denoting a telecast channel and carrying either a channel logo or an alphanumeric call-sign as a means of identification. Horizontally 15 adjacent each channel cell are the program cells 420 carrying the program title of each program scheduled to be telecast on that channel at a particular time. In a position above the program title grid 240, there is an indication of the day 20 of the week and the time of day given in half hour indications 370 enabling the user to identify the start and finish times of particular programs. An indication of the precise date and current time may also be displayed on screen.

The picture-in-graphic box 120 displays the program currently being telecast on the channel corresponding to the row in which a program cell is in focus, allowing the user to surf channels and simultaneously consult the EPG. 25 Additionally, the channel to which the user is tuned may be fixed to a particular channel by selecting a “lock” action when the desired channel’s cell 230 is in focus, as indicated on-screen by a padlock icon 440.

The advertisement panels 140 may contain access (for example, links) to further information regarding the subject matter being advertised, and which may be obtained in different ways by focussing upon them and actioning them in various advertisement specific ways using the keys corresponding to the 5 actions or the “select” key.

The home page 100 includes the currently tuned channel and displays programs starting from the current time. A user may press a right or left cursor key on the remote control to scroll the display of programs to be 10 telecast ahead or back in time, and press the up or down cursor keys to scroll the display up or down within a list of telecast channels.

In a further preferred embodiment, an additional sub-mode feature to the “Telecast” mode is provided whereby it is possible to program future 15 recording of programs which the user may have missed previously. As shown in Figure 13, the above function is achieved by selecting the “Past” option 440 on the menu bar 200. The information displayed on screen changes to that which would have been displayed 24 hours previously. A grid of cells 240 denoting program titles 420 is displayed, the horizontal length of which 20 denotes the duration of the program concerned. Cells that match future repeats of the same program stored within the EPG schedule memory (that, typically, contain details of program schedules for up to two weeks into the future) may be shown in their regular program category coded colour, whereas 25 cells corresponding to programs which are not repeated in schedule memory may be shown in grey with the font in the colour of its program category, as shown in Fig. 13. Highlighting a particular program cell 420 causes the corresponding program note to be displayed in the information panel 180 and the user is provided with the option of setting a future recording of or a

reminder to watch (the “Watch” action) a selected program. Once the “Watch” 260 or “Record” 280 action has been selected, the focused program cell is rendered in a different colour, shade or style to enable the user to see at a glance which programs have been so actioned, as shown in Figures 13a, 13b.

- 5 If a program is not scheduled to be repeated, it is possible for the user to program the system to record the desired program, should the program ever be repeated in the future.

In a preferred embodiment of the present invention, the recorded program may 10 be stored to, for example, Flash memory, or DRAM, or a bulk non-volatile store such as a hard disk or optical storage device.

In a further preferred embodiment, the EPG may be switched from the “Telecast” mode shown in Figure 12 to a “My TV” mode as shown in Figure 15 14. This is achieved by pressing the key on the remote control corresponding to the “My TV” action 320 or, alternatively, by pressing a fixed key on the remote control that is labelled for the purpose.

It is possible to return to the on-screen display of the “My TV” mode home 20 page at any time during use of the EPG in ”My TV” mode by selecting the “Home” action 640, as shown in Figures 14a et sec. Whilst on the respective home page, display of the ”Home” label is replaced by display of the “Telecast” 330 or “My TV” 320 actions to switch between the EPG’s two operating modes “My TV” and ”Telecast” respectively.

25

In ”My TV” mode, the home page displayed on screen shows a different colour (red) menu bar 200 from that displayed in the “Telecast” mode. The menu bar 200 displays the following “My TV”’s submodes: “Catalogue” 460,

“Box Office” 480, “Info” 500, and “Editor” 520. Further “My TV” sub-modes may be viewed by using the right and left cursor keys on the remote control to scroll along the menu bar 200 and thereby reveal further sub-modes. On screen arrows 530 indicate whether there are further options available to be accessed by scrolling right or left respectively.

At any time, only one of the sub-modes denoted on the menu bar may be active. The user activates a particular sub-mode by moving focus to a cell on the menu bar 200 that corresponds to a desired sub-mode and then switches 10 focus away from the cell in a downward direction. While no longer in focus, the cell corresponding to the active sub-mode remains displayed differently to other sub-mode cells to denote the sub-mode the EPG is in.

Highlighting the “Catalogue” cell 460, as shown in Figure 14, causes a block 15 of program title cells 420 and/or program series title cells 430 to be displayed on screen corresponding to those programs or program episodes of a series which have been recorded, and stored, for example, to flash memory, DRAM, or bulk non-volatile storage such as a hard disk or optical storage device.

20 The program and series title cells are presented together in alphabetical order. Programs and series are distinguished on-screen via their status icon 880 according to whether they have “kept” or “unkept” status. Programs or program episodes within series that are marked “unkept” are automatically deleted in cases where the unused storage space (for example disk space) is 25 insufficient to make a new recording. In such cases, the oldest unkept program (i.e. which was recorded first) is deleted. The horizontal cell lengths of the program cells 420 represent the durations of the programs concerned. This is useful to give users a quick at-a-glance appreciation for the duration of

programs. Moreover such methods of representation must accommodate all permutations of short and long program durations displayed at the same time. For example, simultaneous display to scale of a cell depicting a 5 minute news bulletin may be impractical alongside a cell depicting, say, a 6 hour rock concert because the horizontal scale of the news bulletin cell may be too small to accommodate the width of its title.

In a preferred embodiment, the scaling of the horizontal time axis is partially adaptive to the displayed program with the longest duration. Two sets of time marker and tick 960 located above the program cells label the mid and end duration axis points. In cases where the longest displayed program duration equals or exceeds an upper threshold duration (preferably 2 hours), the end axis duration label 970 is marked with the upper threshold duration and all program cell widths are represented accordingly. Cells whose durations exceed the upper threshold duration are displayed as "cut-off", where their right edges are depicted to show that their true duration spills beyond the upper threshold tick, as illustrated by reference numeral 990 in Figure 14. In cases where the longest displayed program duration is less than a lower threshold duration (preferably 1 hour), the end axis duration label is marked with the lower threshold duration and all program cell widths are represented accordingly (not shown).

A viewer's progress into playing a partially viewed program may be shown graphically by rendering the played segment of the program cell bar 420 in a different colour, shade or style compared to the un-played segment. Or, alternatively, the boundaries between played and un-played segments may be marked with a line, tick or some other symbol (not shown).

The program title cells 420 and series title cells 430 may be colour coded by theme category (such as sport, movies and children) to provide the user with an instant means of identifying the category to which a program or series relates. Highlighting a particular program title cell 420 causes the relevant 5 program note to be displayed in the information panel 180, as shown in Figure 14a where the focused cell title is "Aerobics Oz Style". The program note information displayed in "My TV" mode may include details 730 of if, and, if so, when the program is scheduled to be deleted and/ or other information such as program labels like stereo, subtitles or black/white (Fig. 14a, 14c, 14d, 14e, 10 14f, 16, 16a, 18b, 21b, 22a).

While a program title cell 420 or episode title cell 450 is in focus, still frames from the program's or episodes' video track are displayed in sequence to the picture-in-graphic window 120. The display of each frame persists for a short 15 period of a second to a few seconds before it is replaced by the next in the sequence. Once the last frame in the sequence is played, the display rotates back to the first frame and so forth until the user moves focus away from the program or series cell. The frames may be snap-shots taken from the program or series episodes' video at regular intervals of a minute to 10 minutes, or they 20 may be key frames selected by some other means. A moving marker or indicator tick 590 within a program title cell 420 or episode title cell 450 may show the time within the program to which the currently displayed frame relates, as shown in Figure 14a.

25 The user may cause the program corresponding to the cell in focus to be played to the full screen by pressing the "OK" or "Play" key on the remote. Alternatively or additionally, an action label "Play" may be displayed in the action menu. Both the "pause" and "stop" keys on the remote causes playing

of the program to stop and be displaced by the EPG display in “My TV” mode, “Catalogue” sub-mode, with the cell corresponding to the played program in focus. In the case where the Pause button was pressed, a “Resume” action 930 may be displayed to allow the user to resume viewing.

5 This is useful to the user because it immediately causes display of information that is likely to be most pertinent to another play selection. Other keys or key combinations for the actions “Reverse”, “Fast Reverse”, “Forward” and “Fast Forward” may be included on the handset and may be operable both on a program played back in full screen video and on a program displayed in picture-in-graphic mode, corresponding to the program title cell 420 or episode title cell 450 in focus, using the EPG “My TV”, “Catalogue” sub-mode.

10

15 The “Keep” action 720 is displayed where an “unkept” program or series title cell is in focus, as shown in Figure 14b. A user may cause an unkept program or series title cell that is in focus to be “kept” by selecting the “Keep” action 720. In such cases, selecting the “Keep” action causes the program or series title cell 420 to be redisplayed, still in focus, within the stack of ‘kept’ programs with its precise location depending on the time and date of recording

20 (the latest recorded program on top and the earliest recorded program at the bottom of the list), with the “Keep” action label replaced by the “Release” action label 920 (Fig. 14c, 14d). Simultaneously the relevant portion 730 of its program or series note 180 is updated and re-displayed. If there is insufficient unused storage space (for example disk space) for a new telecast

25 program, additional space is found by deleting the oldest recorded, unkept program.

An “Erase” action 900 appears when a program title cell 420 or episode title

cell 450 is highlighted while the EPG is in “MY TV” mode and “Catalogue” sub-mode (Fig 14a, 14b, 14c). When the “Erase” action 900 is selected a message 750 is displayed on screen in the information panel 180 requiring the user to confirm that he wishes to erase the recorded program. This is shown, 5 for example, in Figure 15. The user may confirm his intention by pressing the “OK” key on the remote control, in which case the recorded program is deleted. In the event that the user decides not to proceed with erasing the selected program, he may ignore the message and continue to navigate through other cells, causing display of the message to be removed.

10

Status icons 880 (Fig. 14, 14a, 14b, 14c) communicate at-a-glance the status of each program title cell 420, series title cell 430, or episode title cell 450 to indicate whether it is kept or unkept, and whether it represents a television recording or a recording from another source (e.g. a broadcast radio program) 15 and whether they represent a single program event or a series of programs. When the status icon 880 is in focus, the information panel 180 shows technical, non-content related information associated with the program such as recording quality, length of recording, channel, time and date when the recording is scheduled to be made as well as if and, when the program may be 20 deleted, as shown in Figure 16.

A “series” is a plurality of programs that share a main title. Individual programs within the series are referred to as episodes. While the EPG is in “MY TV” mode and “Catalogue” sub-mode, as shown in Figures 14a, 14b, 25 14c, multiple episodes of a series are depicted using one series title cell 430 that bears a common series title. A series title cell 430 may be displayed in a different style compared to a program cell 420 (not shown). Alternatively they may be distinguished by their status icons 880.

The length of a series title cell 430 corresponds to the sum of the lengths of each recorded episode and is displayed according to the same cut-off rules previously described for program cells whose duration exceeds an upper 5 threshold. The representation of the status icon 880 is according to the first episode to be deleted, if any. For example, if a series is comprised of three individual episodes records, two of which have been ‘kept’ and one of which will be automatically deleted, the status icon will indicate that a deletion will follow in due course.

10

When the status icon 880 of a series title cell 430 is in focus, the information panel 180 shows, where possible, a summary of the information parameter associated with the recorded episodes. For example, if four episodes were recorded in “fine” quality and one in “basic” quality, then information panel 15 180 may contain an extract “Quality: 4xFine, 1xBasic”. As another example, information panel 180 may refer to only the shortest and longest episode durations (not shown).

20

Information and actions concerning individual episodes are accessed by focusing upon the series program title cell 430 (Fig. 14b) and selecting it by pressing the OK button. A new display, as described in Figure 16a, is then shown that lists individual episode title cells 450 for the selected series together with their series title 890, associated status icons 880, relevant action buttons 160 and episode program notes 180. Activating the action button 25 “Back” 390 will cause the display to revert to the previous screen as shown in Fig. 14b.

If free storage (for example, disk) space for recording exists, a cell labelled

“Unused” 860 is displayed beneath the block of program or series title cells as illustrated in Figures 14b, 14c. A user may focus on the “Unused” cell 860 to cause information concerning the amount of free disk space to be displayed in the information panel 180 (Fig. 17).

5

With the “Catalogue” sub-mode cell in focus, a user may select from various search criteria via hot ‘keys’ on the action menu 160. These may include “Theme” 840, “Date” 820 and “Channels” 800 (Fig. 14). Upon pressing the “Theme” action button 840, the user may search for recorded programs from 10 various categories such as Movies, Sports and Childrens’ programs (Fig. 18). When a user makes a selection from a menu of vertically listed sub-categories 600 (Fig. 18, 18a), a new screen is displayed (Fig. 18b) showing all programs recorded that belong to the chosen sub-category. A header 830 may display information about the chosen selected category and sub-category. Upon 15 pressing the action button “Menu” 850 (Figure 18b) the display will revert to the previous menu page (Fig. 18a)

20

25

Upon pressing the “Date” action button 820 with the “Catalogue” sub-mode cell in focus (Fig. 14), the user may search for programs recorded during a particular time period. Figure 19 describes how, responsive to selection of the “Date” action, a vertical arrangement of cells is displayed beneath the horizontal sub-mode menu bar. The first cell, closest to the sub-mode menu bar is labelled “All” and is followed beneath by other cells labelled with historic date ranges of progressively increasing durations (e.g. “Yesterday”, “Last Week”, “Last Month”, “Year 2001”) with distance from the sub-mode menu bar.

The user may use the cursor keys to change the date range cell under focus (Figure 19a).

Responsive to selection of a date range cell that corresponds to a range longer
5 than a day, a successive group of cells is displayed that divides the selected date range into cells corresponding to shorter non-overlapping date sub-ranges. Additionally a cell is displayed in focus corresponding to the full duration of the previously selected data range (Fig. 19b). Date ranges that correspond to periods in the future are greyed out or not displayed at all, and
10 cannot be focused upon (not shown).

Figures 19a and 19b describe an example where a user has selected "Year 2001" to cause display of sub-ranges "All", "Jan", "Feb" etc. and where the "All" cell is immediately placed in focus. Figure 19c describes the case where
15 a month cell in Figure 19b has been selected to cause the cell "All" and a cell for each day of the selected month to be displayed.

Simultaneous to focusing on a date sub-range, titles of programs that correspond to the date range are displayed together with other optional information (such as date of recording or telecast channel) in the information panel 180. Figure 19 shows an example where a user has put the "ALL" cell in focus. The user may further select a focused date range cell by pressing the remote control "OK" key to cause display of a vertical arrangement of program cells that correspond to programs recorded during the selected date range, as illustrated in Figure 14a for the case of selecting the "All" cell shown
25 in Figure 19. The vertical arrangement 240 of program cells 420 or episode cells 450 lists program titles in sequence according to whether they are kept or unkept. Cells corresponding to kept programs are displayed together

uppermost in reverse chronological order of time of recording (i.e. the most recently recorded program title is displayed at the top of the block of kept program cells). Unkept programs are displayed below the “kept” programs in reverse chronological order according to when they were recorded. (i.e. the 5 most recently recorded program title being displayed at the top of the block of unkept program cells).

The user may use the cursor keys to navigate focus between program cells. Simultaneous to focusing on a cell, contextual help information and/or 10 program notes corresponding to the focused cell are displayed in the information panel 180.

The “Up” action 940 may be selected for a focused program cell 420 or episode program cell 450 to promote it up through the program title grid 240 and thereby to demote its position in the queue for deletions needed to make 15 space for new program recordings (Fig.14e, 14f). Each press of the “Up” action 940 causes the focused episode program cell 450 to be displayed in a position swapped with the unkept program above it and maintained in focus. Simultaneously the relevant portion 730 of its program note 180 may be 20 updated and re-displayed (Figure 14e, 14f).

A “Release” action 920 is displayed where the program cell in focus has been kept (Fig 14a). Selecting the “Release” action causes the cell in focus to be demoted vertically down in the program block 420 to the top of the unkept 25 program block. Simultaneously the relevant portion 730 of its program note 180 may be updated and re-displayed (not shown).

Selecting the “Channels” action in the “Catalogue” sub-mode causes a grid

740 of channel cells 620 to be displayed on screen, each cell carrying the logo of a particular channel, as shown in Figure 20. The user may use the cursor keys to change focus between the channel cells 620. Simultaneous to which, contextual help information and/or program notes corresponding to details of 5 the programs that have been recorded on the particular channel are displayed in the information panel 180 (Fig. 21a).

Selecting a focused channel logo cell 620 causes a vertical arrangement 240 of 10 program title cells 420 or episode program cells 450 to be displayed denoting the programs which have been recorded from the selected channel on the storage medium, for example disk, as shown in Figure 21b. Highlighting a particular program cell 420 or episode program cell 450 results in the relevant 15 program note being displayed in the information panel 180. The channel logo 950 or any other form of representation of the relevant channel may be displayed to indicate which channel has been selected.

In a further preferred embodiment, the system includes a sub-mode, "Box Office", for receiving and recording programs and related program or series note information that may be addressed by a television program service provider to a particular set-top-box (STB). These recorded programs and 20 series may be accessed by focusing on the "Box Office" sub-mode 480 on the menu bar 200, as shown in Figure 22, from within "My TV" mode. User interaction with programs, series, episodes and other EPG functionality is similar to the functionality described for the "Catalogue" sub-mode except that 25 the recording of programs and the display of the program title cells associated with them is managed by and at the discretion of a service provider. Consequently, a user does not have facility to "Keep", "Erase" or adjust a recorded program's position in a queue for deletion in order to make way for a

new recordings using the "Up" action described for the "Catalogue" sub-mode.

In the preferred embodiment, the service provider causes automatic, 5 unattended recording of certain programs or series of episodes considered to be of interest to the user. The titles corresponding to these are displayed in the program cells 420 or series cells 430.

At the option of the service provider, a program may be designated "pay-per-view" and incur a one-off payment before it is viewed. A "Buy" action 700 is 10 displayed for such programs when they are in focus. Upon selection by the user of the "Buy" action 700 the user may be requested to confirm the purchase and identify himself by entering a personal identification number (PIN) using keys on the remote. Thereafter the recorded program is 15 responsive to playing in the same manner using the "Play" and "Stop" keys as described for the "Catalogue" sub-mode (not shown).

In a further preferred embodiment, means may be provided whereby the user can access detailed information regarding subjects such as the weather, news, 20 sport or films. This feature is accessed by focusing upon the cell corresponding to the "Info" sub-mode 500 on the menu bar 200, as shown in Figure 23. Information is displayed as articles. Each article comprises one or more pages of hypertext and graphical information displayed in the expanded information panel 190 of Figures 23a, 23b, 23c.

25

Selection of the "Info" sub-mode causes the on-screen display of various information categories, such as news, or sports, or weather. The subsequent selection of a particular category results in the display of a list of related sub-

categories 690, each denoted by a particular cell, as shown in Figure 23. Each information category is represented as a vertical column or block 640 that is subdivided into horizontal, row like cells 660 that represent either articles 680 or sub-categories 690 of articles 680. An article cell 630 is labelled with the 5 title of the article 680 that it represents whereas a subcategory cell 650 is labelled with the title of the subcategory 690 that it represents.

A user may cause an article to be displayed by navigating focus to its respective cell and selecting it for display by pressing the “OK” key on the 10 remote. The article comprises text and graphics information 670 with links 710 to positions within the same or different articles 680. A link 710 may be represented by a text or graphics object which, when placed in focus by the user, is rendered differently using a border, reverse colour or some other style of highlighting as illustrated in Figure 23a. Links may point to different types 15 of objects within the EPG, such as to a program title cell, or to an information article or page. The user may navigate focus between links by using the remote cursor keys.

The type of object pointed to by a link may be represented by the colour or 20 style of the rendering of the link’s display. This is useful to assist a user in making a decision whether to select a link. For example, a segment of text that links to a program cell 420 may be displayed in a red font, while links to advertisements may be shown in a green font (Figures 23b, 23f and 23c, 23d).

25 “Scroll” links 760 and 770 may be displayed in the right margin of article pages to assist the user to page up or down quickly between articles and article pages. Focusing upon and selecting a scroll link depicted as a single up pointing arrow 770 or single down pointing arrow 770 causes either the

previous or following article page within the same article to be displayed respectively. Focusing upon and selecting a scroll link depicted as a double up pointing arrow 760 or double down pointing arrow 760 causes the first page in either the previous or following article to be displayed respectively, 5 where the ordering of articles is determined according to the order in which their article title cells 630 (Fig. 23h) are displayed (for example shown in Fig. 23a, 23b, 23c).

- An article page may contain “Telecast” or “My TV” program links, or 10 “Advertisement” links. Figures 23c and 23d describe how “Telecast” link 780 points to a particular program title cell 420 in “Grid” 240, where user selection of it causes the EPG to change display to “Telecast” mode in “Grid” sub-mode with the linked program cell 420 in focus. A “Back” action label 390 is displayed to allow the user to return to the article page with the link back in 15 focus, as illustrated in Figure 23d. A “My TV” program link has the same functionality as a “Telecast” program link except that it points to a recorded program title cell or series title cell displayed in “My TV” mode and “Catalogue” sub-mode (not shown).
- 20 Further embodiments of program links may cause the EPG to switch to any specified mode, sub-mode or display mode according to the values of parameters embedded within the link object. For example, a program link to a program to be telecast may require that it be displayed with its program notes expanded 190 such as described in Figure 23e. Other embodiments to program 25 links may instead or additionally cause certain specified actions to be performed on the program pointed to by the link according to the values of parameters embedded within the link object. For example, selection of a program link may cause the pointed to program to be recorded (not shown)

An “Advertisement” link 810 (figure 23j) points to an advertisement panel 140 where user selection of it causes the EPG to display the advertisement pointed to (as shown in figure 23f). An action button “Back” 390 will revert the display to the previous screen. Further embodiments of advertisement links may cause the EPG to display the advertisement in any of a number of states according to the values of parameters embedded in the link object. Selection of an advertisement link 810 may cause the pointed advertisement to be displayed in one of multiple possible modes. For example, an advertisement link may have parameter values embedded within it that cause the advertisement to be displayed in an expanded form 190. In another example, the selecting of an advertisement link may cause the response portion of a home shopping advertisement to be partially completed with user order details (not shown).

A subcategory 690 may have one or more articles associated with it. For example, the “News” category may contain sub-categories such as, for example, “UK” or “Europe”. Category and sub-category cells are rendered differently in colour, shading, shape or style to article cells (being displayed as a right arrow in Figure 23). A user may cause the display of the article title referred to by a sub-category cell by focussing upon, then selecting it with the “OK” remote key. Pressing the “OK” key causes the category block 640 to be smoothly scrolled to the left, and replaced entirely with the article cells 630 referred to by the focused sub-category 690 (Figure 23g) smoothly scrolled into position from the right, with focus switching to the top article 540 as illustrated in Figure 23h. The user may use the remote cursor keys to navigate focus between article cells, simultaneous to which, excerpts of the focused article may be displayed simultaneously in information panel 180 (not shown).

An article may be selected for display by pressing the “OK” key or the ‘info’ key on the remote control.

5 Certain article titles and content are time critical or frequently changing (for example sports results, weather information or breaking news). Consequently, they must be downloaded to the STB in real time immediately following a user’s selection of a category, sub-category or article for display. Such titles and content are downloaded into the STB immediately following their selection by the user from a source pointed to by a broadcast network carousel address, internet URL or some other form of network pointer that is present in 10 the STB immediately prior to the user’s selection of the article.

15 The categories, sub-category, title and article content information may have been stored on the user’s storage medium, for example disk, and may be individually “addressed” either to a specific user or to a group of users for automatic downloading to the storage medium. Addressing is performed by broadcasting data headers for each item of information (e.g. a category, an article). Contained within each header is a logical function of parameters and variables names that correspond to associated data values stored within each 20 STB at the point when the expression is evaluated. An example of such an expression is “PostCode = ‘SL*’ AND Version = ’123.4’ AND STBFreeMemory >= 512” (which would be evaluated true by STBs with Version ID “123.4” whose postcode locations both have an “SL” prefix and have, say, 512kBytes or more of free memory). The STB downloads the 25 header and executes the logical expression therein to determine whether it is true or false. The information item is downloaded if the expression is evaluated as true. Expressions that refer to parameters not recognised by a particular type or version of STB are evaluated as false.

In the preferred embodiment, information that is not overly time sensitive is broadcast with other EPG information such as program listings or advertisements three to four times daily and received by the STB when it is in standby. Other, time sensitive information may be received live from a broadcast or downloaded in real-time immediately after it is selected for display by a user. The different sources of the information may be denoted visually on screen, for example, article titles available from a live broadcast carousel may be marked with a channel logo 790 denoting the channel from which they are available (Fig. 23j) and the maximum time delay before downloading of the article is complete may be indicated in the information panel 180.

- A further information category which may be provided is entitled "Magazine".
- 15 This category may provide on-screen access to particular magazine titles such as TVGuide™, the Radio Times™ and Sky™ that give program reviews and viewing recommendations such as that shown in Figures 24 to 26. A sponsor's logo 870 may be included for each relevant category.
- 20 Each magazine title is allocated to a particular sub-category and may contain multiple articles therein. Similar to that previously described for other information categories, the system may be arranged such that a particular STB downloads only magazines appropriate to its requirements and that these may be conditionally downloaded to STB non-volatile memory (such as a hard drive or flash memory) where their associated logical header expression is evaluated by the STB to be true. For example, a requirement for downloading of the Sky™ magazine sub-category, and its articles therein, may be that the
- 25

EPG is configured to include either the “Sky One” or “Sky Sports” channel and that the STB has in excess of 10Mbytes of free, non-volatile memory.

The functions of the EPG described above may be implemented using a PVR system shown in Figures 27 and 28. The PVR 1000 of Figure 27 receives a digital broadcast transmission 1010 which may contain a number of MPEG2 transport streams containing MPEG2 encoded video, audio or data elementary digital streams. This digital broadcast 1010 may be delivered to the PVR 1000 by means of a digital satellite transmission, a digital cable transmission, a digital terrestrial transmission or a digital transmission carried on a broadband digital subscriber line (DSL). The PVR 1000 de-multiplexes and decodes the audio and video streams and passes them to the TV receiver 1020 by means of a base-band SCART connection or via the RF aerial connection by means of a re-modulated signal.

The digital broadcast transmission 1010 delivers the TV and Radio services to
5 the PVR. It also delivers data services including the programme listings information required by the electronic programme guide (EPG). News, weather, sports and other information services may be received by the PVR as data services. Advertisement panels and other advertising information are received by the PVR as data services.

10 Figure 28 shows the internal functional elements of the PVR shown in Figure 27. This comprises a CPU 1200 coupled to volatile (DRAM) 1220, non-volatile (Flash) memory 1230 and program memory 1240. The DRAM memory 1220 is used to contain temporary information not required after cycling the STB into and out of a standby or off state. The Flash memory 1230
15 is used mainly to store preloaded data such as programme schedule listings, but it may also contain any information recovered from the digital broadcast

transmission 1250 at anytime. For example, news, sport or weather information may be extracted from a frequently updated broadcast carousel.

The program memory contains the PVR operating software. In a preferred 5 embodiment, the program memory also contains the EPG application software. However, the EPG application software maybe received from the digital broadcast transmission and subsequently stored to flash memory, DRAM or bulk non-volatile storage such as a hard disk or optical storage device. In order to utilise bulk non-volatile storage, such as a hard disk 1260, 10 the PVR requires an interface 1270. This would typically be an ATAPI or SCSI hard disk interface, but any popular bulk data storage interface standard may be applicable.

The PVR contains a programmable tuner 1280, which is connected to the physical transmission termination. This termination may be a cable 15 termination, satellite LNB, terrestrial aerial or a broadband digital subscriber line terminator (DSL). By means of the internal data bus 1290 the EPG can instruct the tuner to receive any MPEG2 transport stream (channel) present on the tuner input, including that stream (channel) carrying the host transmission.

The tuned transport stream is applied to a de-multiplexer 1300, which enables 20 elementary audio, video and data streams to be extracted.

Video data streams are applied to the MPEG2 video decoder 1310. The output of this decoder is then combined with the on screen display OSD 1320 to provide the video signal to the TV display device. The OSD 1320 is responsible for displaying all graphical elements of the EPG application, 25 including the advertisement panels. The video mix and scale function 1330 is

capable of scaling the decoder video in order to present a reduced size live picture within the EPG display. This is the picture in graphic (PIG) display.

5 Audio data streams extracted by the de-multiplexer are applied to the digital audio decoder / driver 1340. This function converts the digital audio stream into an analogue signal in order to apply it to the loudspeaker(s) within the TV.

10 Data streams extracted from the digital broadcast transmission 1250 may be carrying information such as the programme schedule listings. During the broadcast data preload period and at any other time, this information may be cached in flash memory or transferred to bulk storage (in the case of a PVR).

There is also a real time clock (RTC – not shown) within the PVR.

15 Immediately prior to each data preload period, the RTC generates an interrupt to the CPU 1200 causing it to wake from the standby state (if it is already in this state). The CPU then activates those parts of the PVR required to transfer preload data from the digital broadcast transmission 1250 to flash memory 1230 or bulk storage 1250. This includes instructing the programmable tuner 1390 to tune to the transport stream (channel) carrier, present on the transmitted data that contains the host broadcast transmission.

20 Many of the functional elements described in Figure 28 may be combined on a single large-scale integration (LSI) silicon component.

In the case of an Integrated Digital TV (IDTV) all the components described in Figure 28 are resident within the TV chassis.

Various modifications to the embodiments described above may be apparent.

In particular, whilst the preferred embodiments have been described with reference to an STB system, it will be appreciated that the invention could be applied either to television, personal video recorder (PVR), video-cassette-recorder (VCR), personal computer (PC) or radio systems. Furthermore, it
5 will be appreciated that the layout of the on-screen display and location of the cells may vary from that described above as examples of preferred systems embodying the invention.

A skilled person will appreciate that variations of the disclosed arrangements
10 are possible without departing from the invention. Accordingly, the above description of a specific embodiment is made by way of example and not for the purposes of limitation. It will be clear to the skilled person that minor modifications can be made without significant changes to the operation described above.

15

Reference to means for performing various steps and functions is to be understood to include all suitable variants under the doctrine of equivalents and is not to be limited to the disclosures of the specific embodiments described above.

CLAIMS:

1. A system for providing an electronic program guide for television or radio programs comprises:
 - means for presenting listings of present or future programs on-screen;
 - means for presenting listings of past programs on-screen and
 - means, associated with the on-screen listings of past programs, for indicating whether the past program is available again at a future time.
2. A system according to claim 1, wherein the means for indicating the availability of the past program at a later date, is operable to highlight within the on-screen listings of past programs, programs that are to be repeated.
3. A system according to claim 1 or 2, further comprising means for receiving a user selection of a past program.
4. A system according to any one of the preceding claims, further comprising means responsive to the user selection for generating options for the user to select.
5. A system according to claim 4, wherein the options include record or watch functions.
6. A system according to any preceding claim, further comprising means operable so that on selection of the record function, the system is automatically set to cause a repeat of the selected past program to be recorded.
7. A system according to any preceding claim, further comprising means operable so that on selection of the watch function, the system is automatically

set to notify the viewer when a repeat of the selected past program is about to be broadcast.

8. A system according to any preceding claim, wherein the guide is
5 presentable in a grid format, with time along one axis of the grid and channel along another axis of the grid.

9. A system according to claim 8, wherein time is presented along a horizontal axis of the grid

10 10. A system according to claim 8 or 9, wherein channel is presented along a vertical axis of the grid.

11. A computer program, preferably on a data carrier, for providing an
15 electronic program guide for television or radio programs, the computer program including instructions for:

presenting listings of present or future programs on-screen;
presenting listings of past programs on-screen and
indicating in association with the on-screen listings of past programs
20 whether the past program is available again at a future time.

12. A method for providing an electronic program guide for television or radio programs that includes:

receiving program listings information;
25 presenting listings of present or future programs;
presenting listings of past programs and
indicating whether the past program is available again at a future time.

13. A method according to claim 12, wherein the step of indicating includes highlighting in the guide programs that are to be repeated.
14. A method according to claim 12 or 13, further comprising receiving a user selection of a past program and generating options for the user to select.
15. A method according to any of claims 12 to 14, wherein the options include record and/or watch functions.
- 10 16. A method according to claim 15, wherein on selection of the record function, recording of a repeat of the selected program is set automatically.
- 15 17. A method according to claim 15 or 16, wherein on selection of the watch function, the method further comprises automatically notifying the viewer when a repeat of the selected program is about to be broadcast.
18. A method according to claim 17, wherein the step of automatically notifying the viewer comprises generating and presenting an icon a pre-determined time prior to the start of the program.
- 20 19. A system for providing an electronic program guide for television or radio programs comprising:
 - means for presenting listings of present or future programs on-screen;
 - means for presenting listings of past programs on-screen;
- 25
 - means for receiving user selections of functions associated with past programs, for example recording or watching or listening;

means for identifying whether the past program is to be repeated and means for activating the selected function associated with the past program in the event that the past program is repeated.

5 20. A system according to claim 19, wherein the means for identifying whether the past program is to be repeated comprises means for searching the past and future listings to determine a match between the listings information.

10 21. A system according to any of claims 19 or 20, further comprising means associated with the on-screen listings of past programs for indicating whether the past program is available again at a future time.

22. A method for providing an electronic program guide for television or radio programs, the method comprising:

15 presenting listings of past programs on-screen;
 receiving user selections of functions associated with past programs, for example recording or watching or listening;
 identifying whether the past program is to be repeated and
 activating the selected function associated with the past program in the
20 event that the past program is repeated.

25 23. A method according to claim 22, wherein the step of identifying whether the past program is to be repeated comprises searching past and future program listings to determine a match between at least part of the listings information.

24. A system according to claim 23, wherein the part of the listings information compared is a program and/or episode identifier.

25. A computer program for providing an electronic program guide for television or radio programs, the computer program comprising instructions for:
- 5 presenting listings of past programs on-screen;
- receiving user selections of past programs for recording or watching or listening;
- identifying whether the past program is to be repeated and causing the repeat of the past program to be recorded or notifying the
- 10 user of the repeat of the past program, in the event that the past program is repeated.
26. A computer program according to claim 25, wherein the computer program is on a data carrier.
- 15
27. A computer program according to claims 25 or 26, wherein the instructions for identifying whether the past program is to be repeated comprise instructions for searching past and future program listings to determine a match between at least part of the listings information.
- 20
28. A computer program according to any of claims 25 to 27, wherein the part of the listings information compared is a program and/or episode identifier.
- 25
29. A system for providing an electronic program guide for television or radio programs comprising:
- means for presenting listings of present or future programs on-screen;
- and

means for presenting listings of past programs on-screen.

30. A computer program according to any of claims 25 to 29, further comprising means for identifying past programs.

5

31. A computer program according to claim 30, wherein the means for identifying past programs comprises means for comparing the stop time of programs with real time derived from either a real time clock or a downloaded real time signal, thereby to identify programs that have finished.

10

32. A computer program according to claim 31, wherein the means for comparing is operable to compare the stop time of programs with real time derived from either a real time clock or a downloaded real time signal each time the electronic program guide is accessed by the viewer.

15

33. A system for handling information controllable from an electronic program guide for television or radio programs, the system comprising:

means for receiving information in a user's system;

means for storing the received information in the user's system;

20

means for displaying access to the stored information by means of a user interface; and

control means for enabling the user to select one of a plurality of management options for controlling the operation of the stored information through the user interface.

25

34. A system according to claim 33, wherein the means for storing the received information is Flash memory, DRAM, a non-volatile, or an optical storage device.

35. A system according to claim 34, wherein the means for storing the received information is a hard disk.
- 5 36. A system according to any of claims 33 to 35, wherein the means for receiving the information is an aerial, satellite, cable or ADSL receiver.
- 10 37. A system according to any of claims 33 to 36, further comprising means for erasing stored information from the means for storing the information.
38. A system according to any of claims 33 to 37, further comprising means for automatically deleting stored information from the means for storing the information.
- 15 39. A system according to claim 38, wherein the means for automatically deleting stored information from the means for storing the information is arranged to delete the stored information in response to detection of insufficient storage space for recordal of desired information.
- 20 40. A system according to any of claims 33 to 39, further comprising means for categorising received information.
- 25 41. A system according to claim 40, wherein the means for categorising received information is operable to categorise the information according to subject matter, date of receipt and/or storage of the information by the system, or channel on which the information was transmitted.

42. A system according to any of claims 40 or 41, wherein the means for categorising further comprises allocating a colour identifier to different categories of stored information.
- 5 43. A system according to any of claims 33 to 42, further comprising means for searching the stored information.
- 10 44. A system according to claim 43, wherein the means for searching for the stored information is operable to search by date of receipt and/or storage of the information by the system, and/or subject matter, and/or channel on which the information was transmitted.
- 15 45. A system according to any of claims 33 to 44, further comprising means for displaying a portion of the stored information in the user interface on selection of associated stored information by the user.
- 20 46. A system according to any of claims 33 to 44, wherein the means for receiving information is adapted to receive information provided by a service provider, and/or the user.
- 25 47. A system according to any of claims 33 to 44, further comprising means for presenting listings of present or future programs on-screen, means for presenting listings of past programs on-screen and means associated with the on-screen listings of past programs for indicating whether or not the past program is available again at a future time.
48. A system according to claim 47, wherein the means for indicating whether or not the past program is available again at a future time is operable

to highlight within the on-screen listings of past programs, programs that are to be repeated.

49. A system according to any of claims 47 or 48, further comprising
5 means for receiving a user selection of a past program.

50. A system according to claim 49, further comprising means responsive to the user selection for generating options for the user to select.

10 51. A system according to claim 50, wherein the options include record and/or watch functions.

15 52. A system according to claim 51, further comprising means operable so that on selection of the record function, the system is automatically set to cause a repeat of the selected past program to be recorded.

20 53. A system according to any of claims 51 or 52, further comprising means operable so that on selection of the watch function, the system is automatically set to notify the viewer when a repeat of the selected past program is about to be broadcast.

54. A system according to any of claims 33 to 53, wherein the guide is presentable in a grid format, with time along one axis of the grid and channel along another axis of the grid.

25

55. A system according to claim 54, wherein time is presentable along a horizontal axis of the grid

56. A system according to claims 54 or 55, wherein channel is presentable along a vertical axis of the grid.
57. A system according to any of claims 47 to 56, further comprising means for identifying whether the past program is to be repeated and means for activating the selected function associated with the past program in the event that the past program is repeated.
- 10 58. A system according to claim 57, wherein the means for identifying whether the past program is to be repeated comprises means for searching the past and future listings to determine a match between the listings information.
- 15 59. A system according to any of claims 47 to 58, further comprising means associated with the on-screen listings of past programs, for indicating whether the past program is available again at a future time.
60. A method for handling information controllable from an electronic program guide for television or radio programs, the method comprising:
receiving information in a user's system;
20 storing the received information in the user's system;
displaying links to the stored information by means of a user interface;
and
controlling the selection one of a plurality of management options for controlling the operation of the stored information through the user interface.
25
61. A method according to claim 60, further comprising visually displaying information relevant to the status of the stored information.

60

62. A method according to claim 61, wherein the step of visually displaying information comprises displaying information on whether or not the information has been viewed by the user, and/or whether or not the user has elected to keep or delete stored information, and/or the viewing duration of stored information, and/or the progress of viewed information.

Johnny Steccino: Roberto Benigni - Italy 1991. Dante is a kind hearted loser. His life is defined by his job (as a schoolbus driver for a school for the mentally handicapped), his friendship with one of his charges (with whom he shoplifts bananas), a pathetic insurance scheme, and his utter inability to get a woman.

He is filled with hope one day when a beautiful, romantic, whimsical woman falls into his life and invites him to visit her at her villa in Sicily. Little does Dante know that lovely Maria (Nicoletta Braschi) is the wife of mafioso 'Johnny Steccino', who has ratted out his cohorts and now lives in fear of his life.

Dante and Johnny look exactly alike (no surprise, since they are both played by Roberto Benigni). Maria, Johnny and their 'medicine' taking lawyer hatch a plot to get Dante killed in place of Johnny. A comedy of errors ensues. The plot might be trite, but it is pulled off with timing and comic genius.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/GB 02/01557

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 H04N5/445

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
IPC 7 H04N

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

PAJ, EPO-Internal, WPI Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category °	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	PATENT ABSTRACTS OF JAPAN vol. 1999, no. 08, 30 June 1999 (1999-06-30) & JP 11 088280 A (SHARP CORP), 30 March 1999 (1999-03-30) abstract ---	1,11,12, 19,22, 33,60
P, X	EP 1 104 189 A (FUJITSU LTD) 30 May 2001 (2001-05-30) abstract paragraph '0110! ---	1,11,12, 19,22, 33,60
A	US 6 172 674 B1 (ETHEREDGE ROBERT C) 9 January 2001 (2001-01-09) column 15, line 50 -column 20, line 61; figures 19-28 --- -/--	1-62

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

° Special categories of cited documents :

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family
